

**RESTORING RIVERS TO STAGE 0: A
PROCESS- BASED APPROACH TO
RETURNING A DEPOSITIONAL RIVER VALLEY
TO AN ANASTOMOSING CHANNEL NETWORK**

Sue Niezgoda, Ph.D., P.E., Gonzaga University

Paul Powers, Matt Helstab, Kate Meyer

USFS, Oregon

What is Stage 0?

Post-2000 research challenges single-thread, meandering as a natural, ubiquitous pre-disturbance condition:

Europe - Tony Brown, John Lewin, Nicola Surian

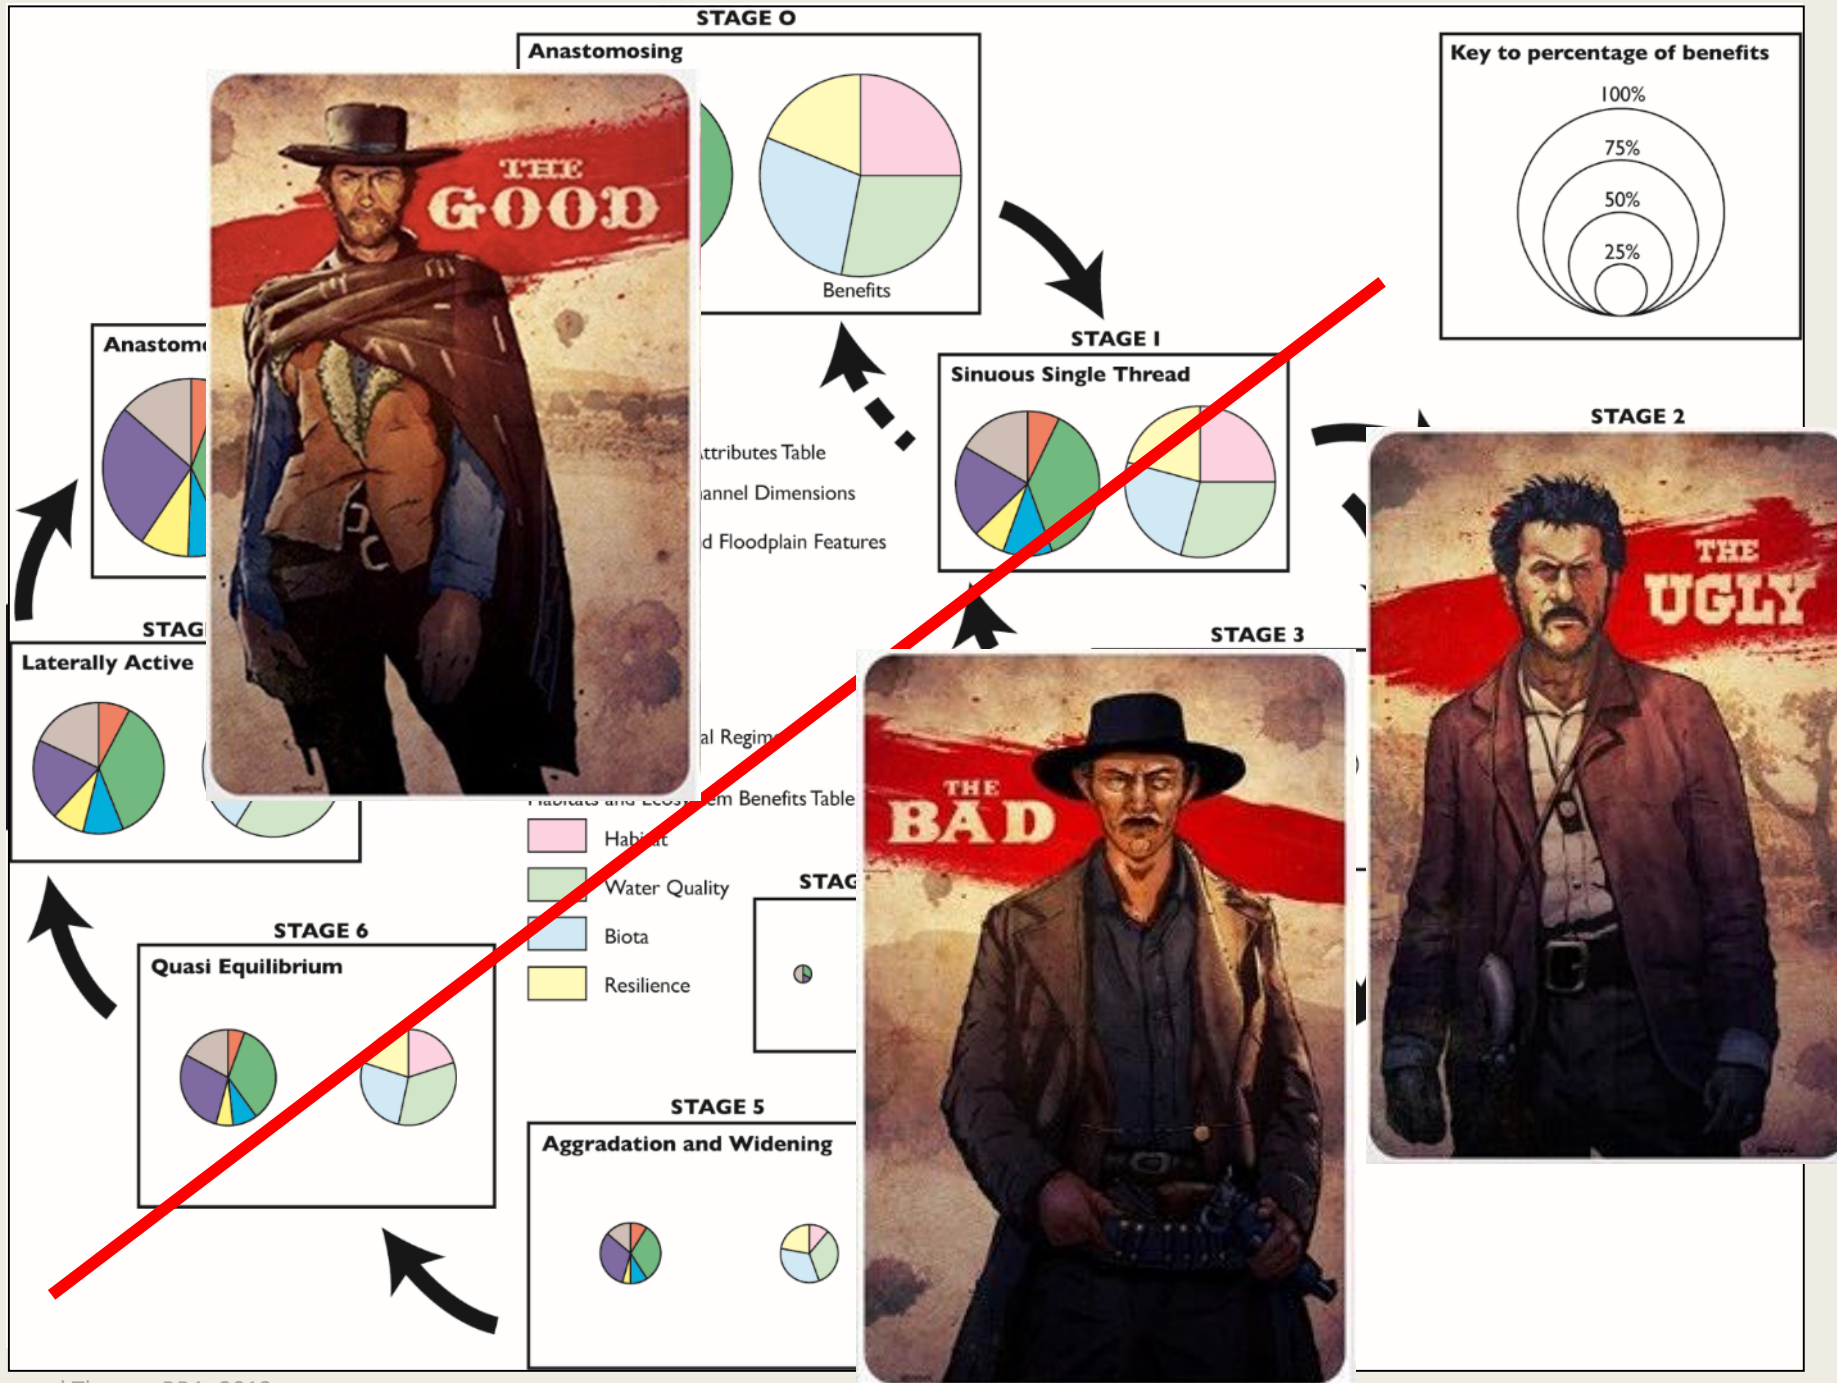

Eastern US - Robert Walter and Dorothy Merritts

California - Robert Grossinger and others

Pacific Northwest - Dave Montgomery and Collins

What Distinguishes Stage 0 and Why Restore to Stage 0?

Attributes

- 1. Depositional Zones
 - *Transport capacity limited*
 - *When mature, supply and capacity may balance, with strong particle exchange and sorting*
- 2. Large Space
 - *Max flood attenuation*
 - *Max GW exchange*
 - *Max sediment pulse attenuation*
 - *Resilient to entire range of watershed processes and pulses*

Benefits

Benefits

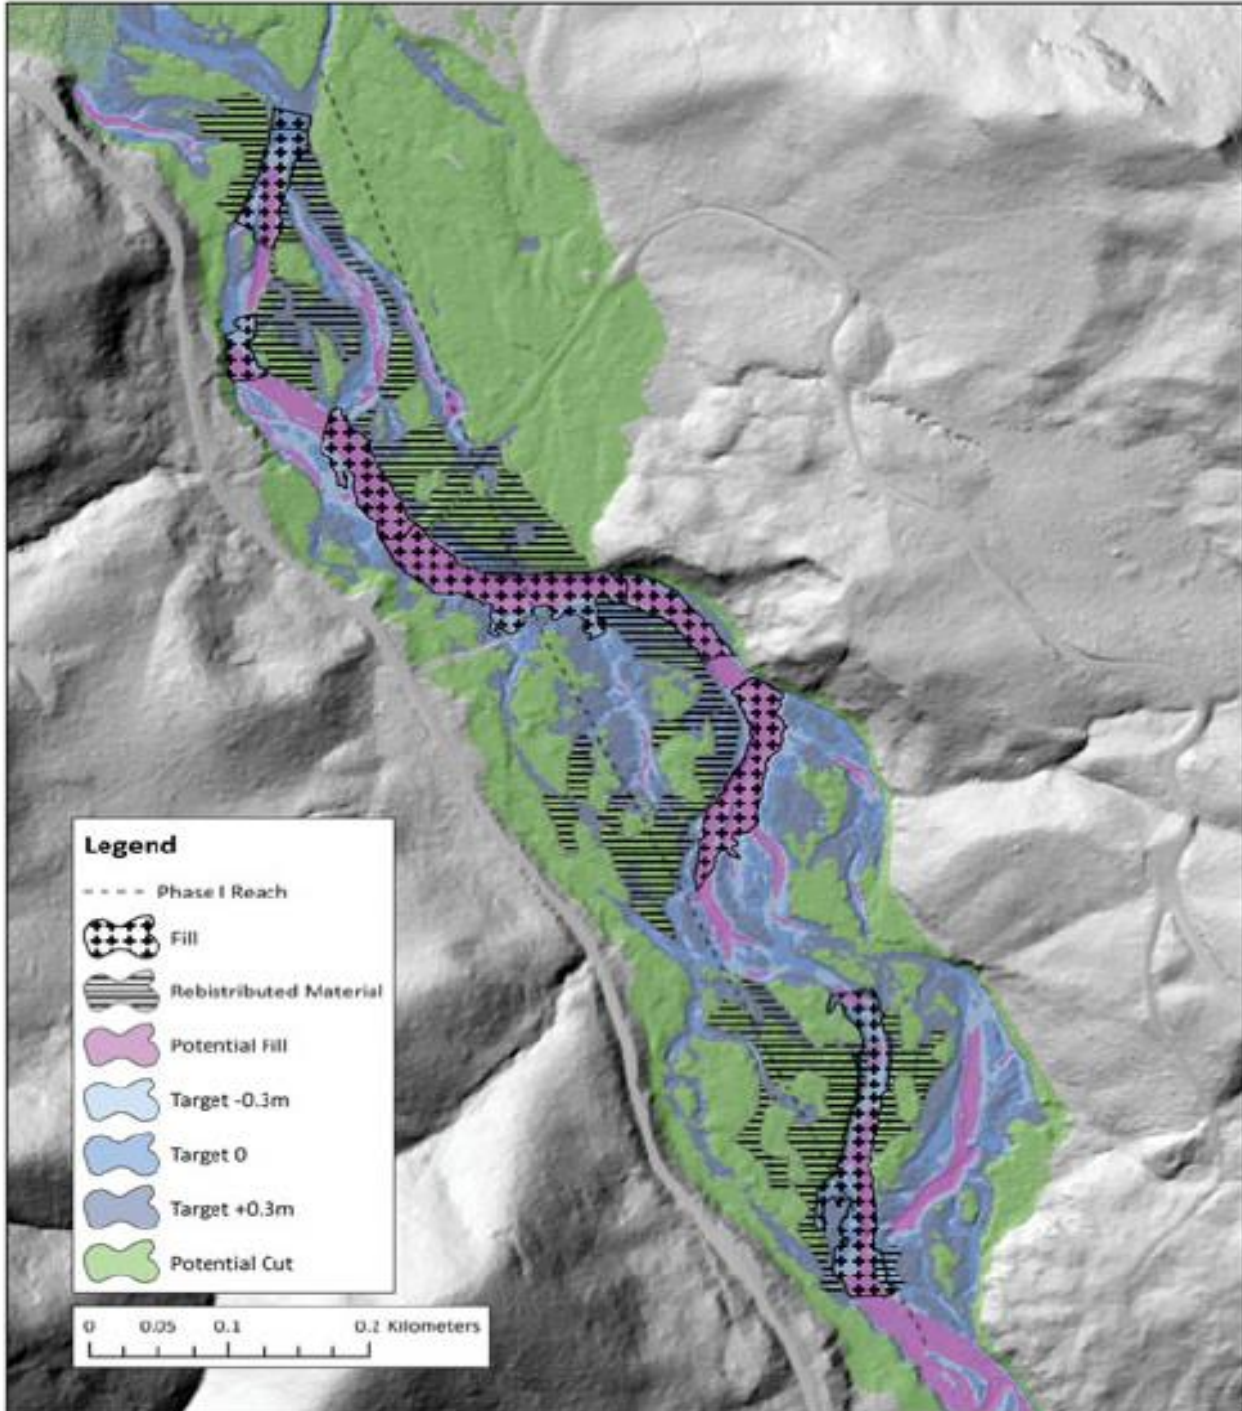

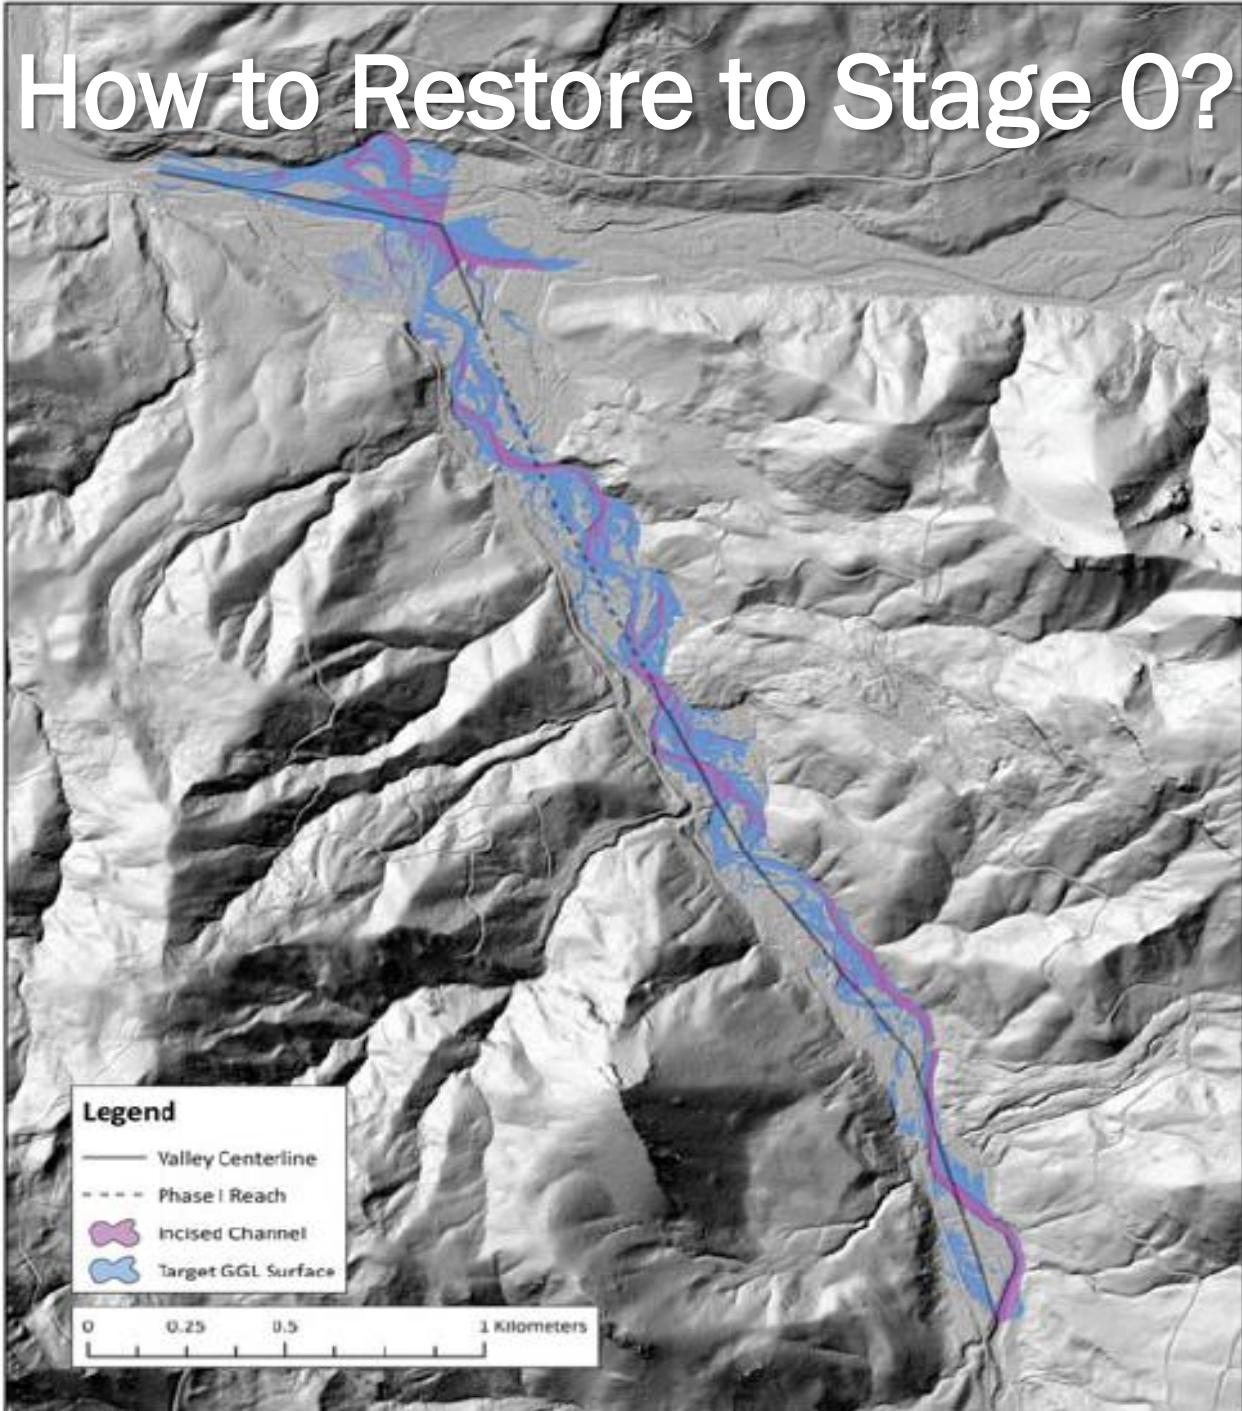

Significant Biodiversity and Biological Function

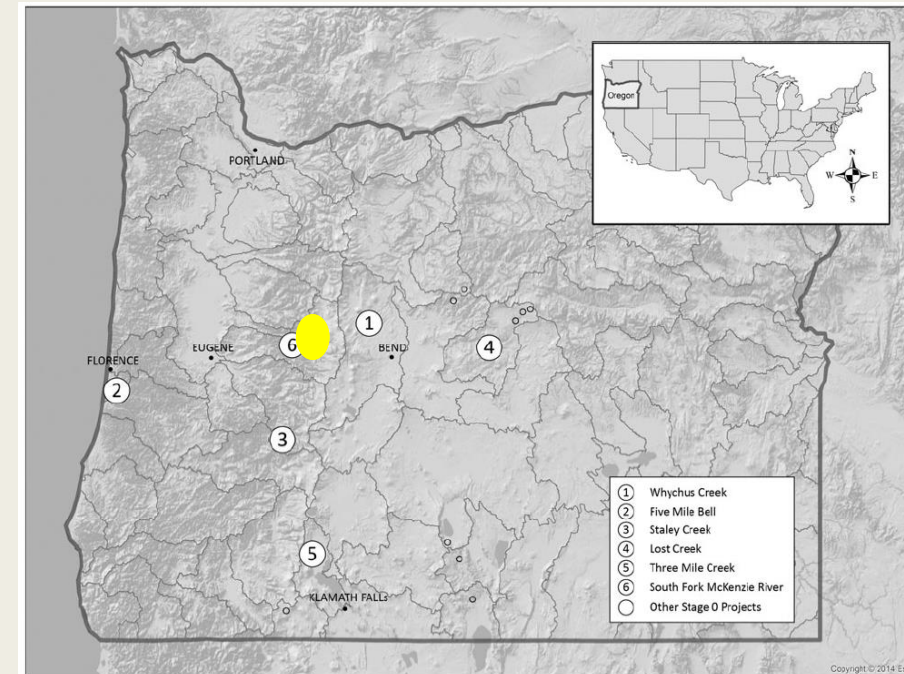

High Water Quality

How to Restore to Stage 0?

Deer Creek Stage 0 Restoration Project

- Historically . . .
 - Depositional alluvial valley (high wood load, sediment storage)
 - Spawning and rearing habitat for ESA-Threatened spring Chinook salmon and foraging habitat for ESA-Threatened bull trout
 - Productive habitat for cutthroat and rainbow trout, sculpin, etc.

Deer Creek – Land Management History

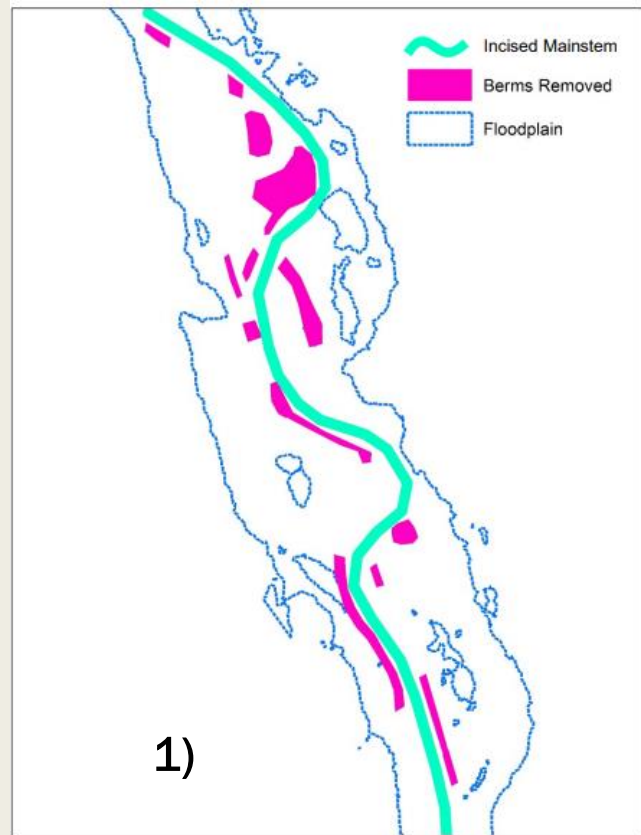

- Historic riparian logging and stream clean-out reduced channel and floodplain roughness
 - *1964 flood scoured entire valley bottom*
- Constructed berms and channelized the stream
- Created a single-thread transport channel with minimal floodplain connectivity

Deer Creek Project Goal

Deer Creek Design

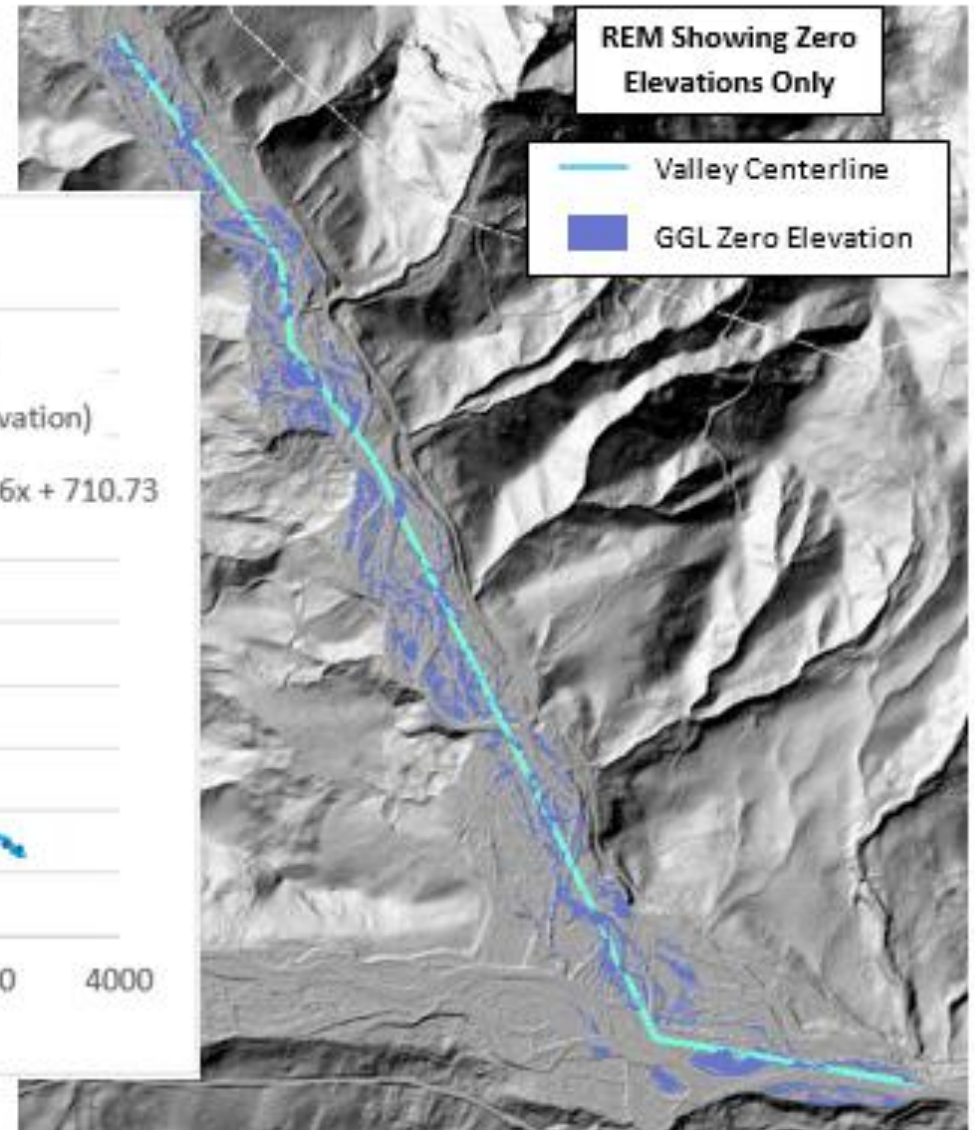

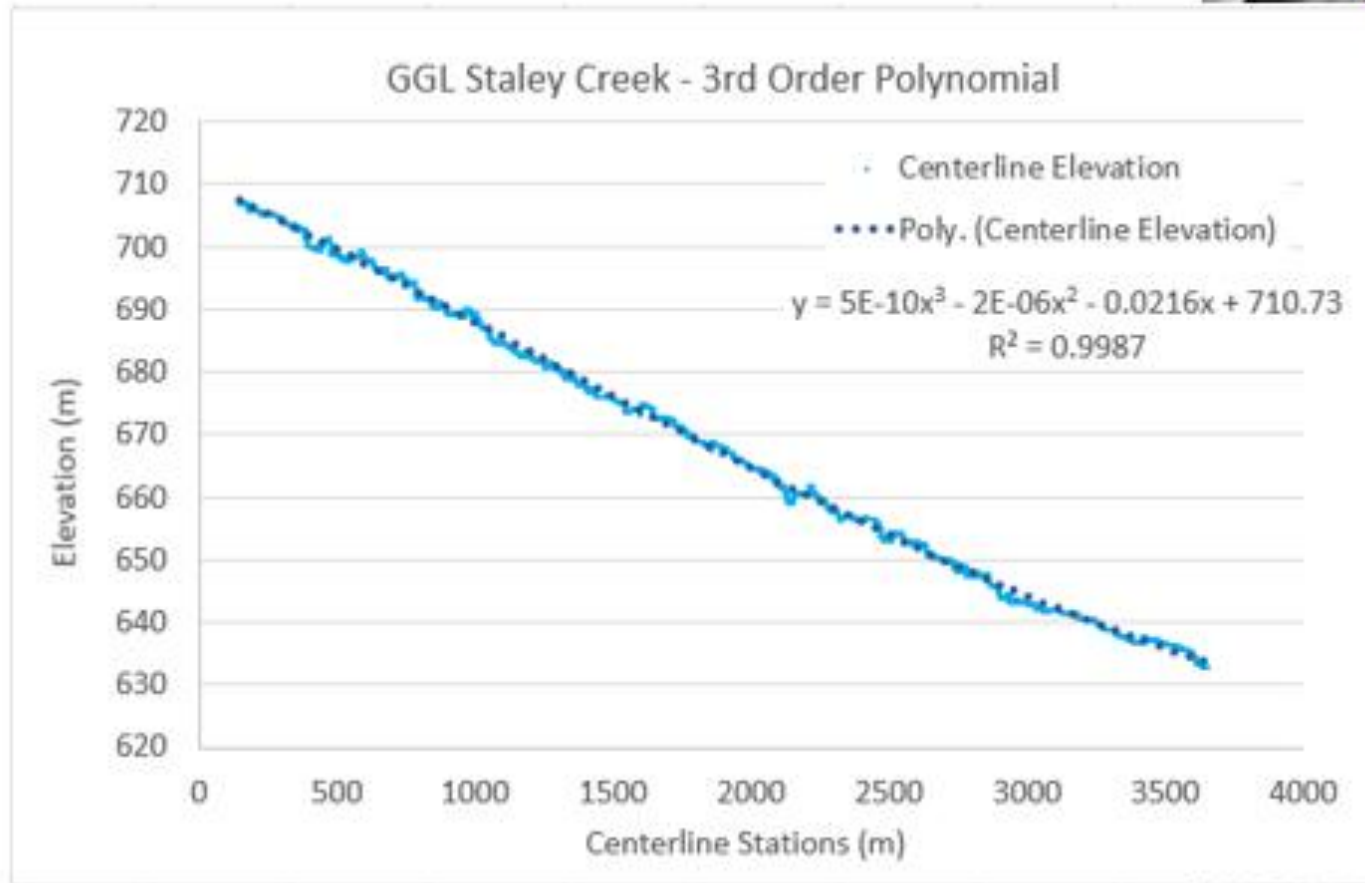

1) Identify all artificial berms and features

2) "Reset" valley bottom elevations for full connectivity by redistributing berm material into incised channel

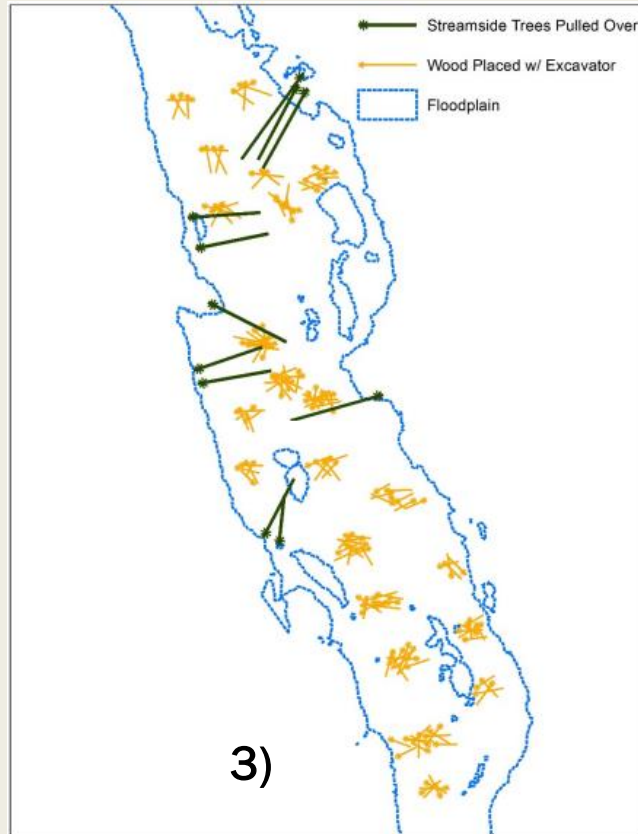

3rd Order GGL and Zero Elevation REM

ArcMap GGL/REM Toolbox
Provided by USFS
Powers et al. 2018

Deer Creek Design

3) Add large wood throughout the valley bottom to create hydraulic complexity and dissipate energy wherever channels may migrate

4) Allow natural processes to create dynamic channels, islands, bars, and complex habitat

Implementation

- 200 trees pushed over and placed
- Berms were pushed into incised channel
- 450 pieces of large wood were placed in jams and single pieces throughout valley bottom

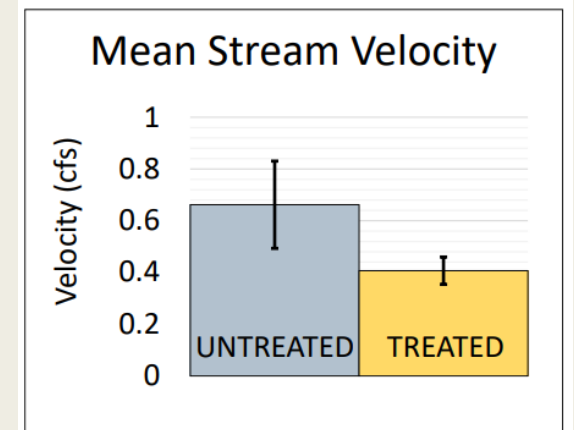

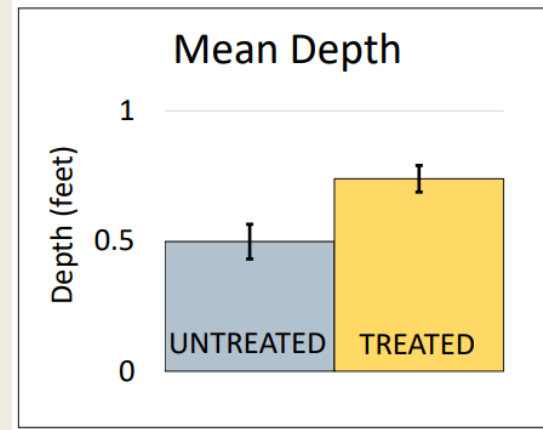

Monitoring Results Untreated and Treated

Wetted Segment Data

- *Depth*
- *Velocity*
- *Temperature*
- *Substrate Size*
- *Geomorphic Feature*
- *LWM*
- *Riparian Vegetation*

Collect data on each wetted segment along transect

WHEN??

WHY??

An aerial photograph of a lush, green forested landscape. A winding river flows through the center of the scene, surrounded by dense evergreen trees. In the background, a range of mountains is visible under a clear blue sky with some light clouds. The overall scene is vibrant and natural.

Embrace the restoration of dynamism and diversity through restoring the processes that create multifaceted river systems that provide long term resiliency, metastability, and more complex and diverse habitat and optimal ecosystem benefits.

Open Your Eyes to the Possibilities!

Geomorphic Grade Line Relative Elevation Model

ArcMap Python Toolbox

Getting Started:

- Ensure you have ArcGIS version 10.3 or 10.6.
- Download the toolbox and place it in the appropriate folder folder.

- ☐ GGL REM Toolbox
 - 1. Create a Centerline Feature Class
 - 2. Create Cross Sections
 - 3. Create GGL Table and Centerline Stations
 - 4. Create Relative Elevation Model
